ERA5→CONUS404 Latent CorrDiff

Frequency-domain detail, CorrDiff comparison, Anderson Creek Fire case study

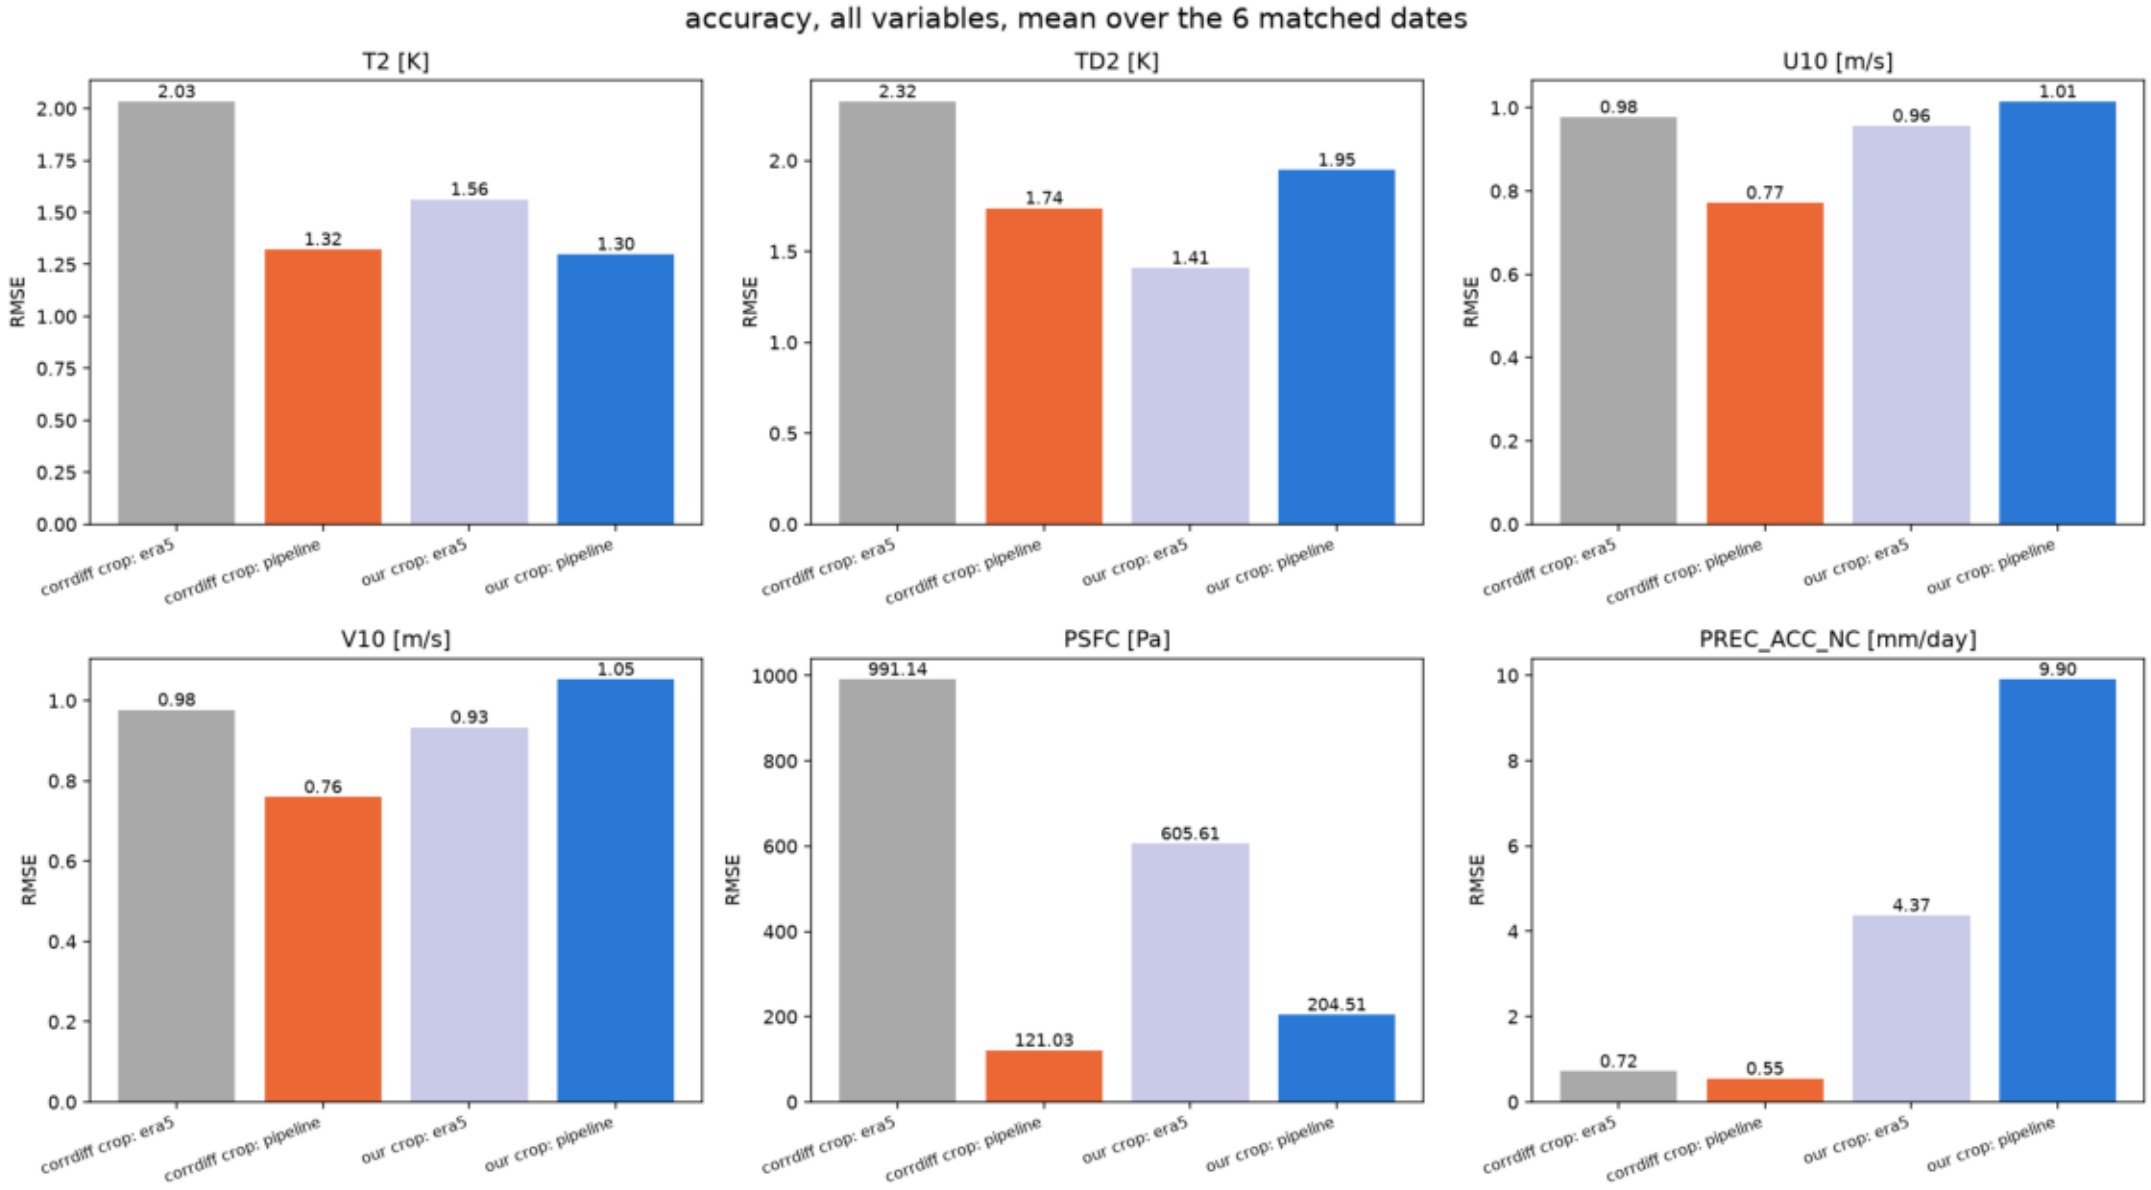

power spectrum, all variables

ours vs corrdiff, T2 and precip only, mean RMSE

accuracy, all variables, corrdiff vs ours

CorrDiff training time, one clean pass

Regression (CorrDiffRegressionUNet, 5,000,000 steps): 7 SLURM jobs, 3 days 7 hours 39 minutes compute, about 318.6 GPU-hours on 4xA100

Diffusion (EDMPrecondSuperResolution, 5,000,000 steps): 10 SLURM jobs, 4 days 23 hours 2 minutes compute, about 476.1 GPU-hours

Total: 17 jobs, 8 days 6 hours 40 minutes compute, about 794.7 GPU-hours

Wall clock span: 8 days 18 hours 11 minutes (longer than compute time because of two multi hour SLURM queue waits between resubmissions)

Our training time (DRN + VAE + diffusion), clean path only

DRN: 17 jobs, 3 days 9 hours 29 minutes compute, about 326 GPU-hours

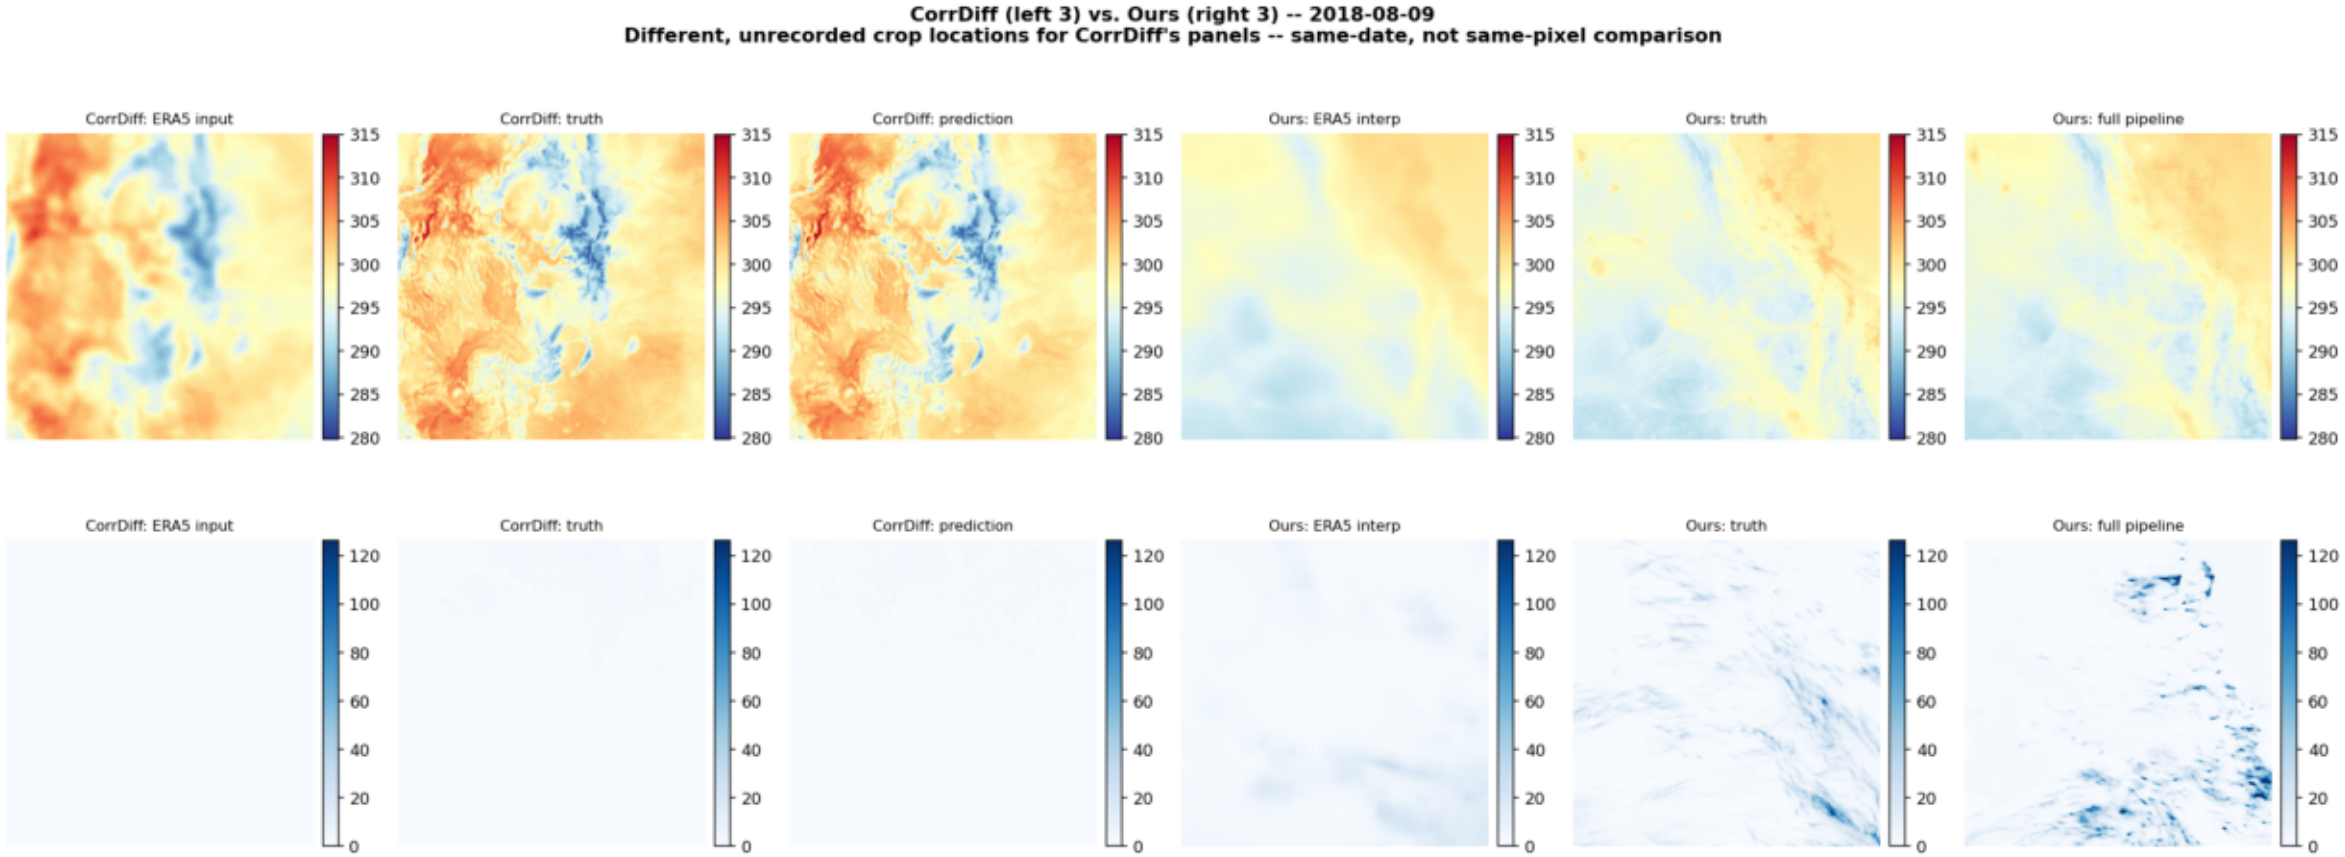

VAE: 4 jobs, 1 day 13 hours 17 minutes compute, about 149 GPU-hours

Diffusion: 16 jobs, 6 days 1 hour 37 minutes compute, about 582 GPU-hours (only reached epoch 106 of a planned 300)

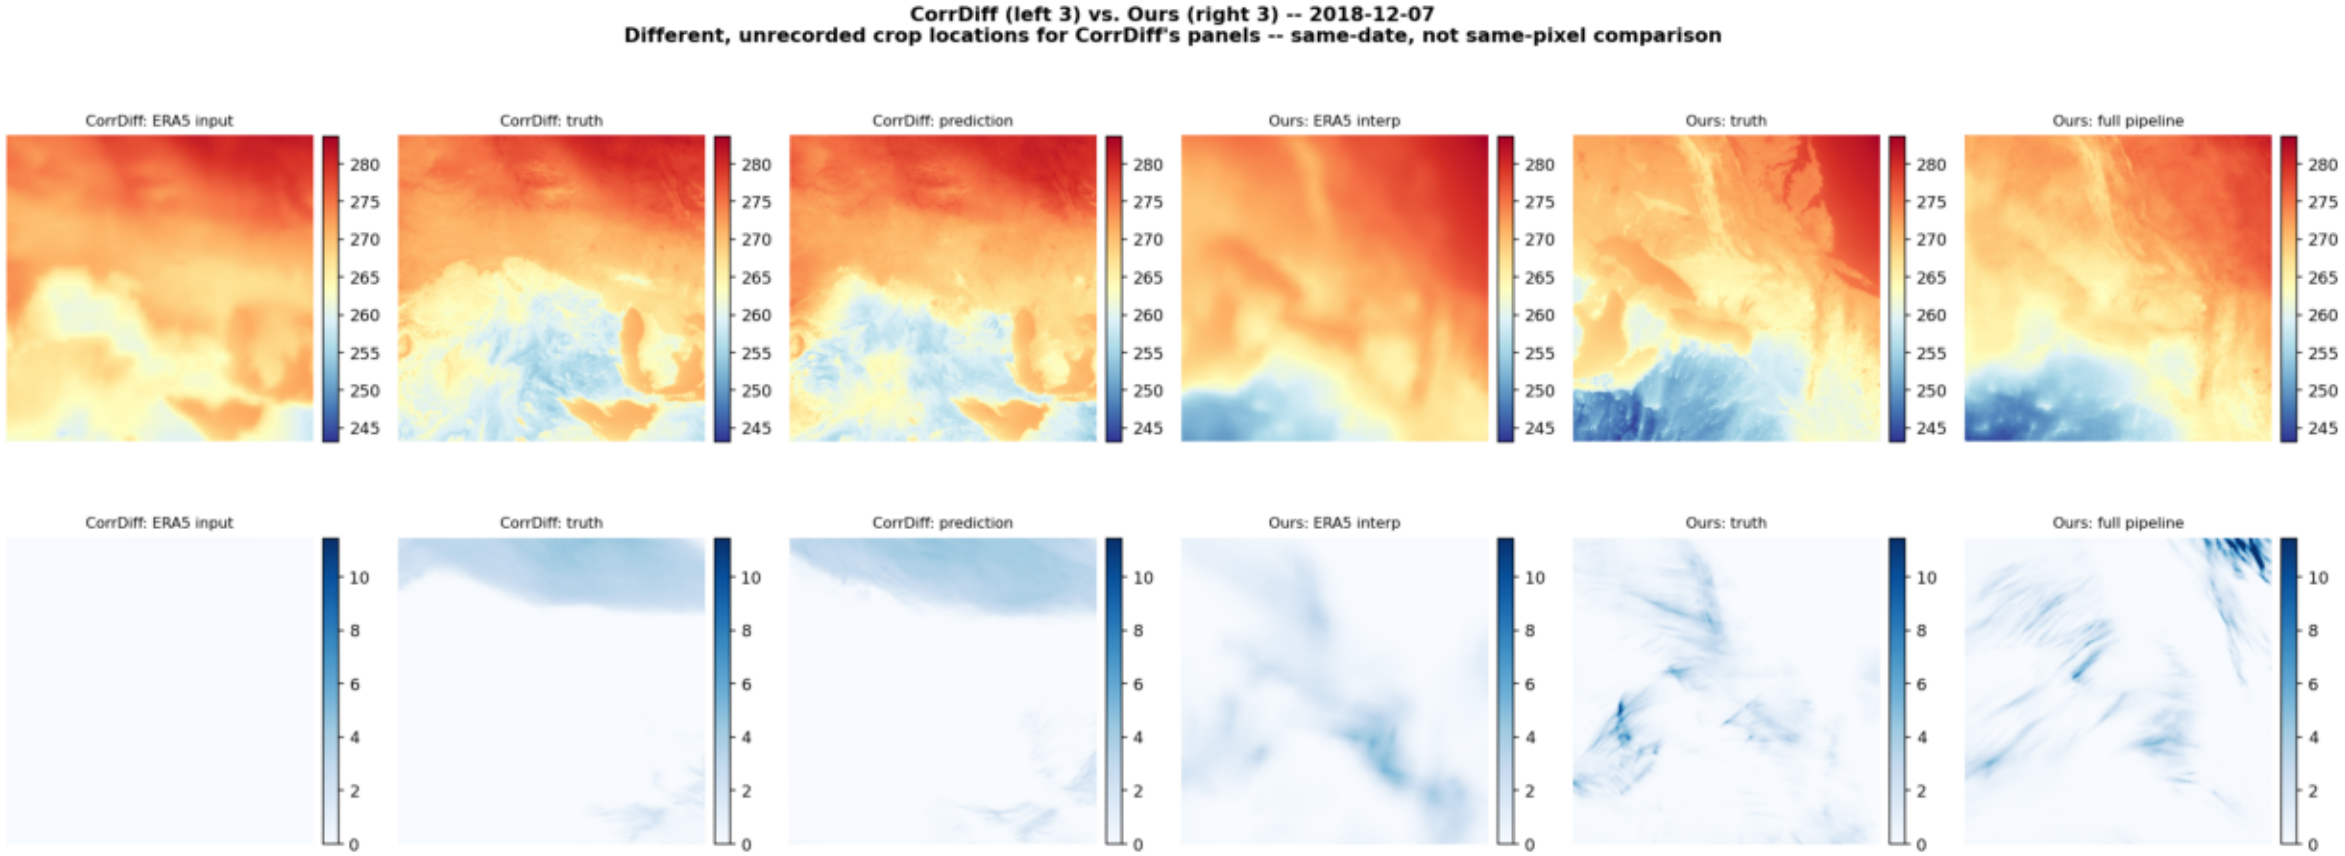

Total: 37 jobs, 11 days 0 hours 23 minutes compute, about 1,058 GPU-hours

This is more total GPU-hours than CorrDiff's 794.7, even on the clean path, because our pipeline has three stages (DRN, then VAE, then diffusion) against CorrDiff's two (regression, then diffusion)

corrdiff vs ours, 2018-12-07, same date, different map locations

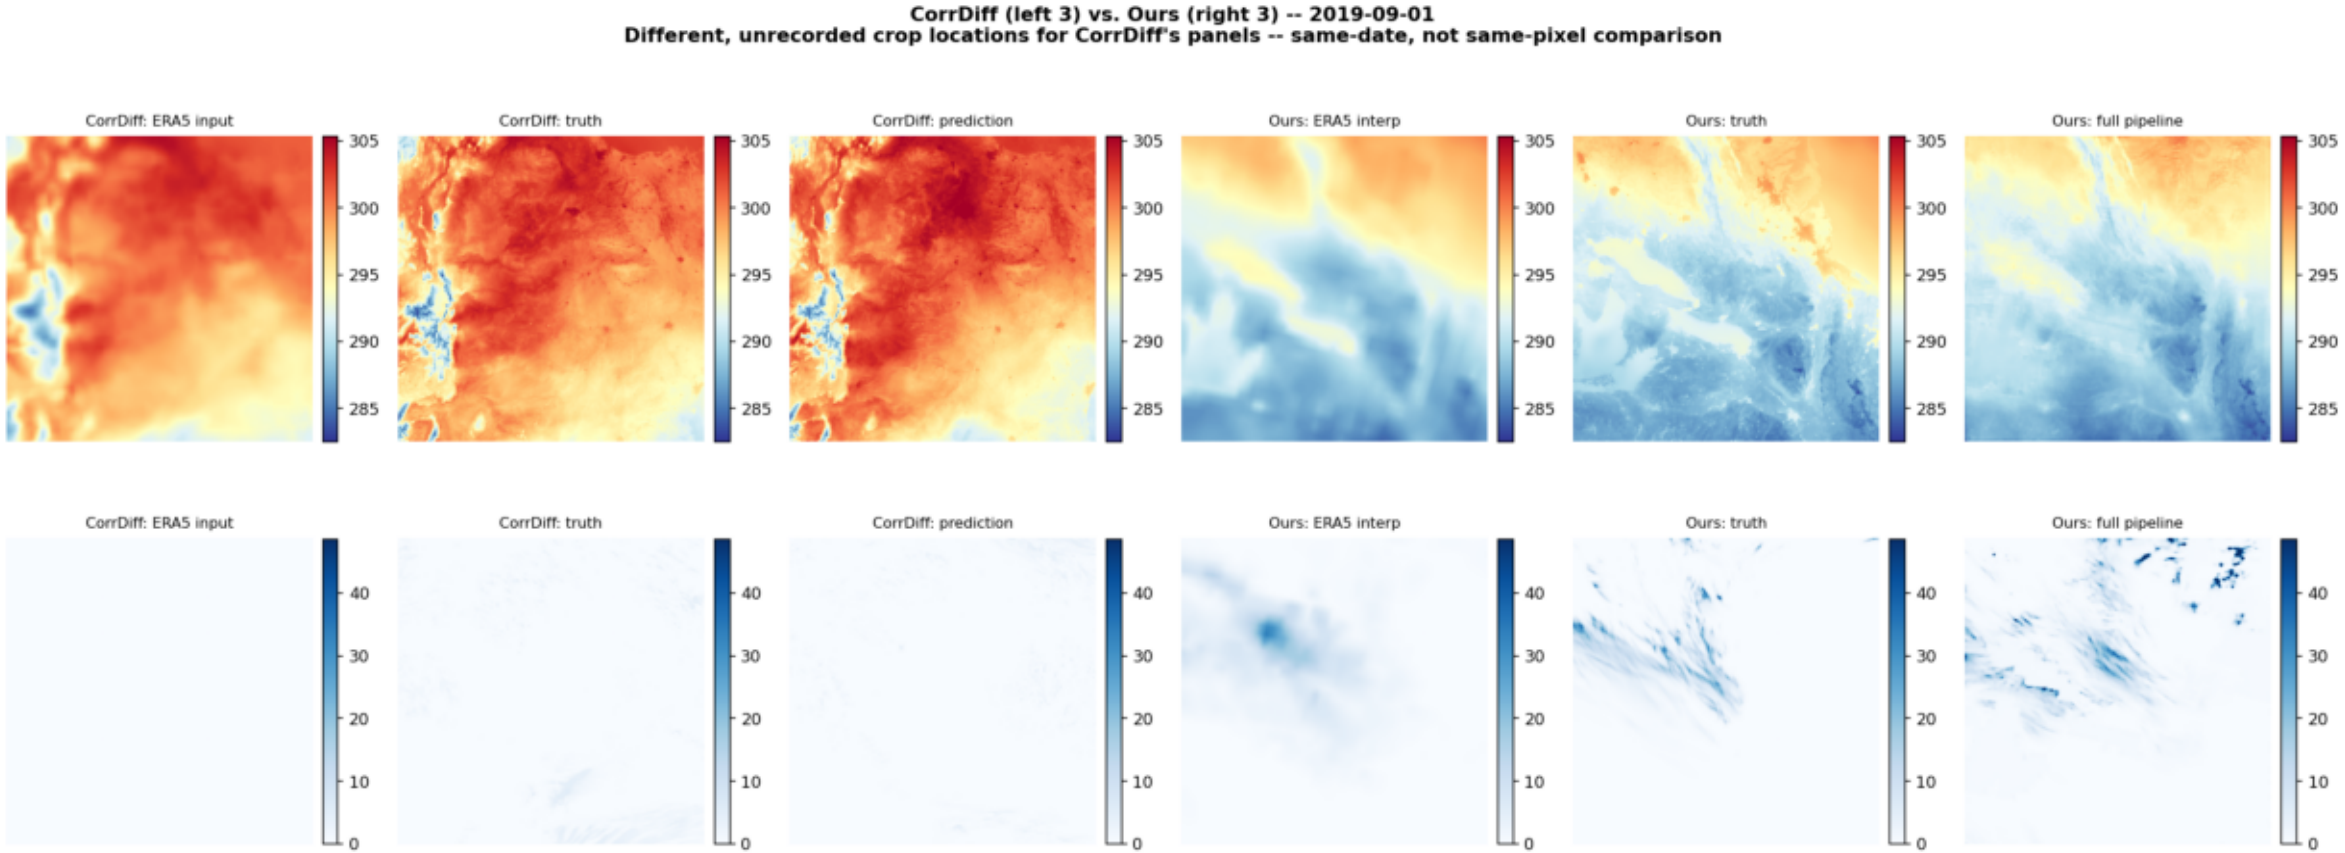

corrdiff vs ours, 2019-08-18, same date, different map locations

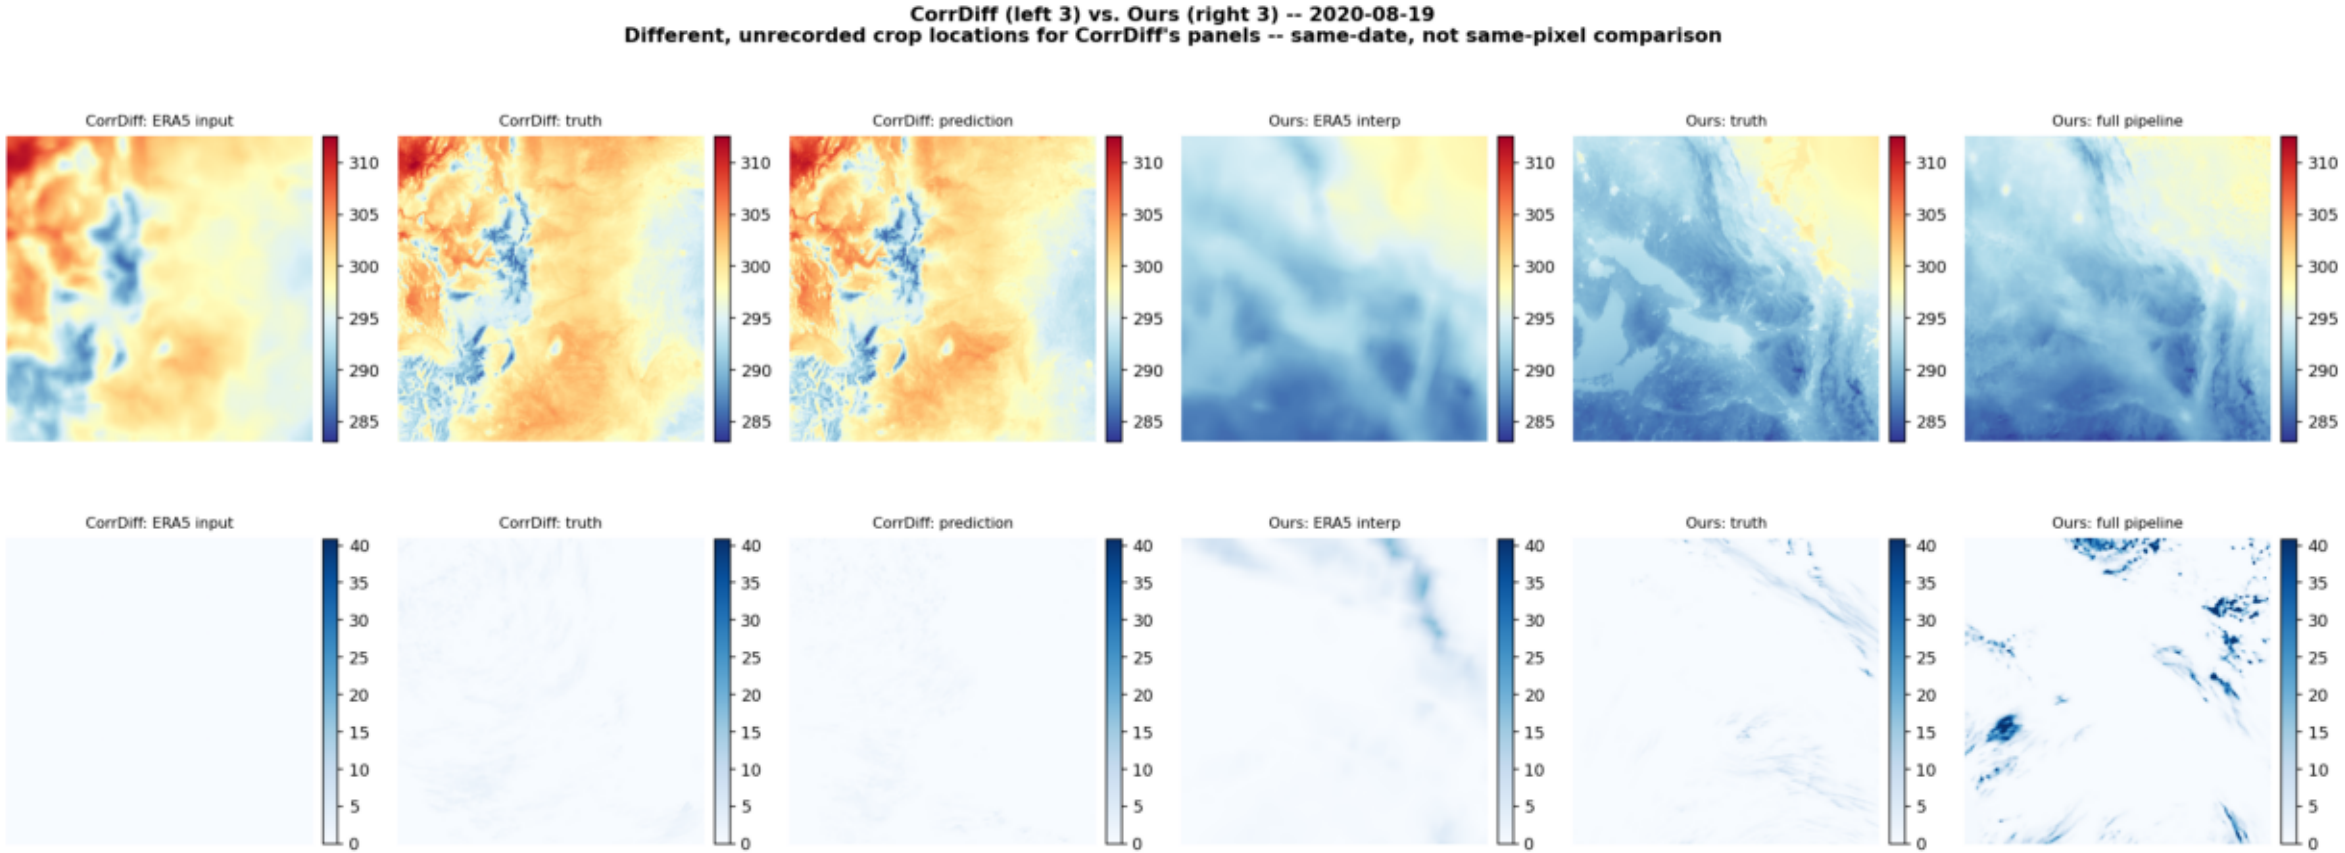

corrdiff vs ours, 2019-08-25, same date, different map locations

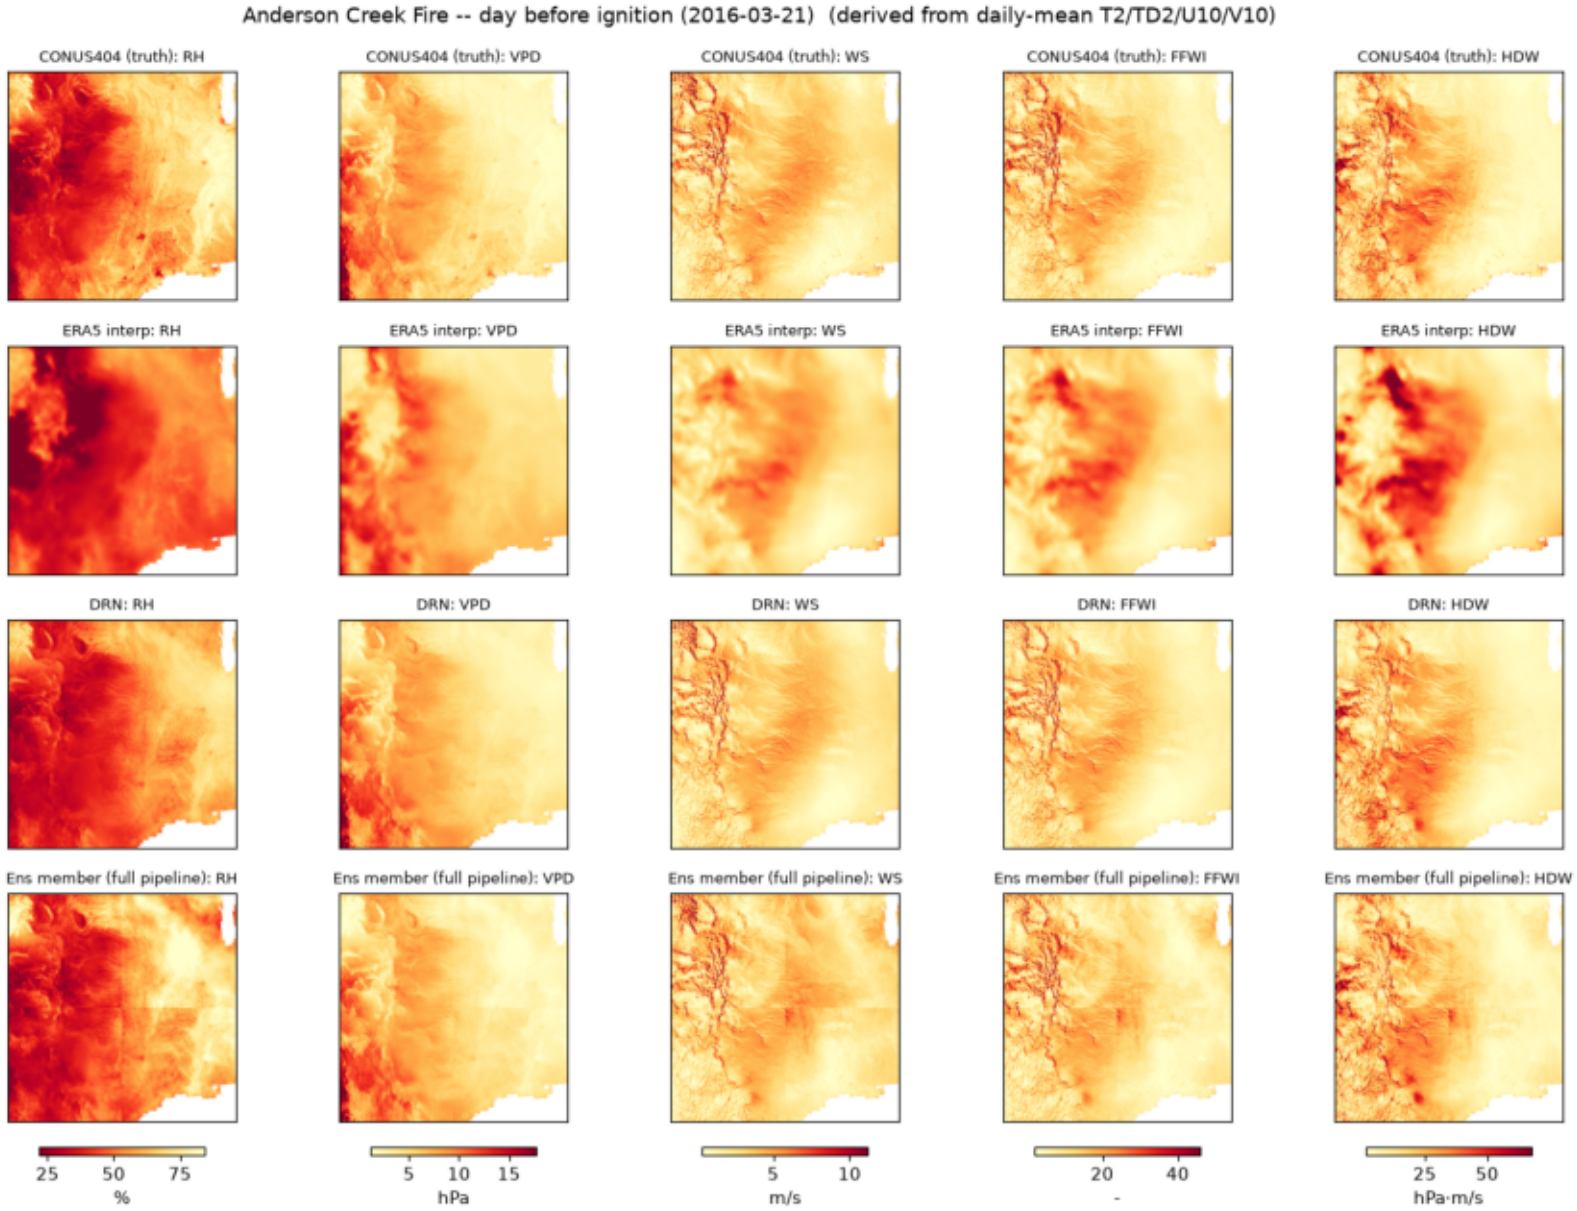

corrdiff vs ours, 2019-09-01, same date, different map locations

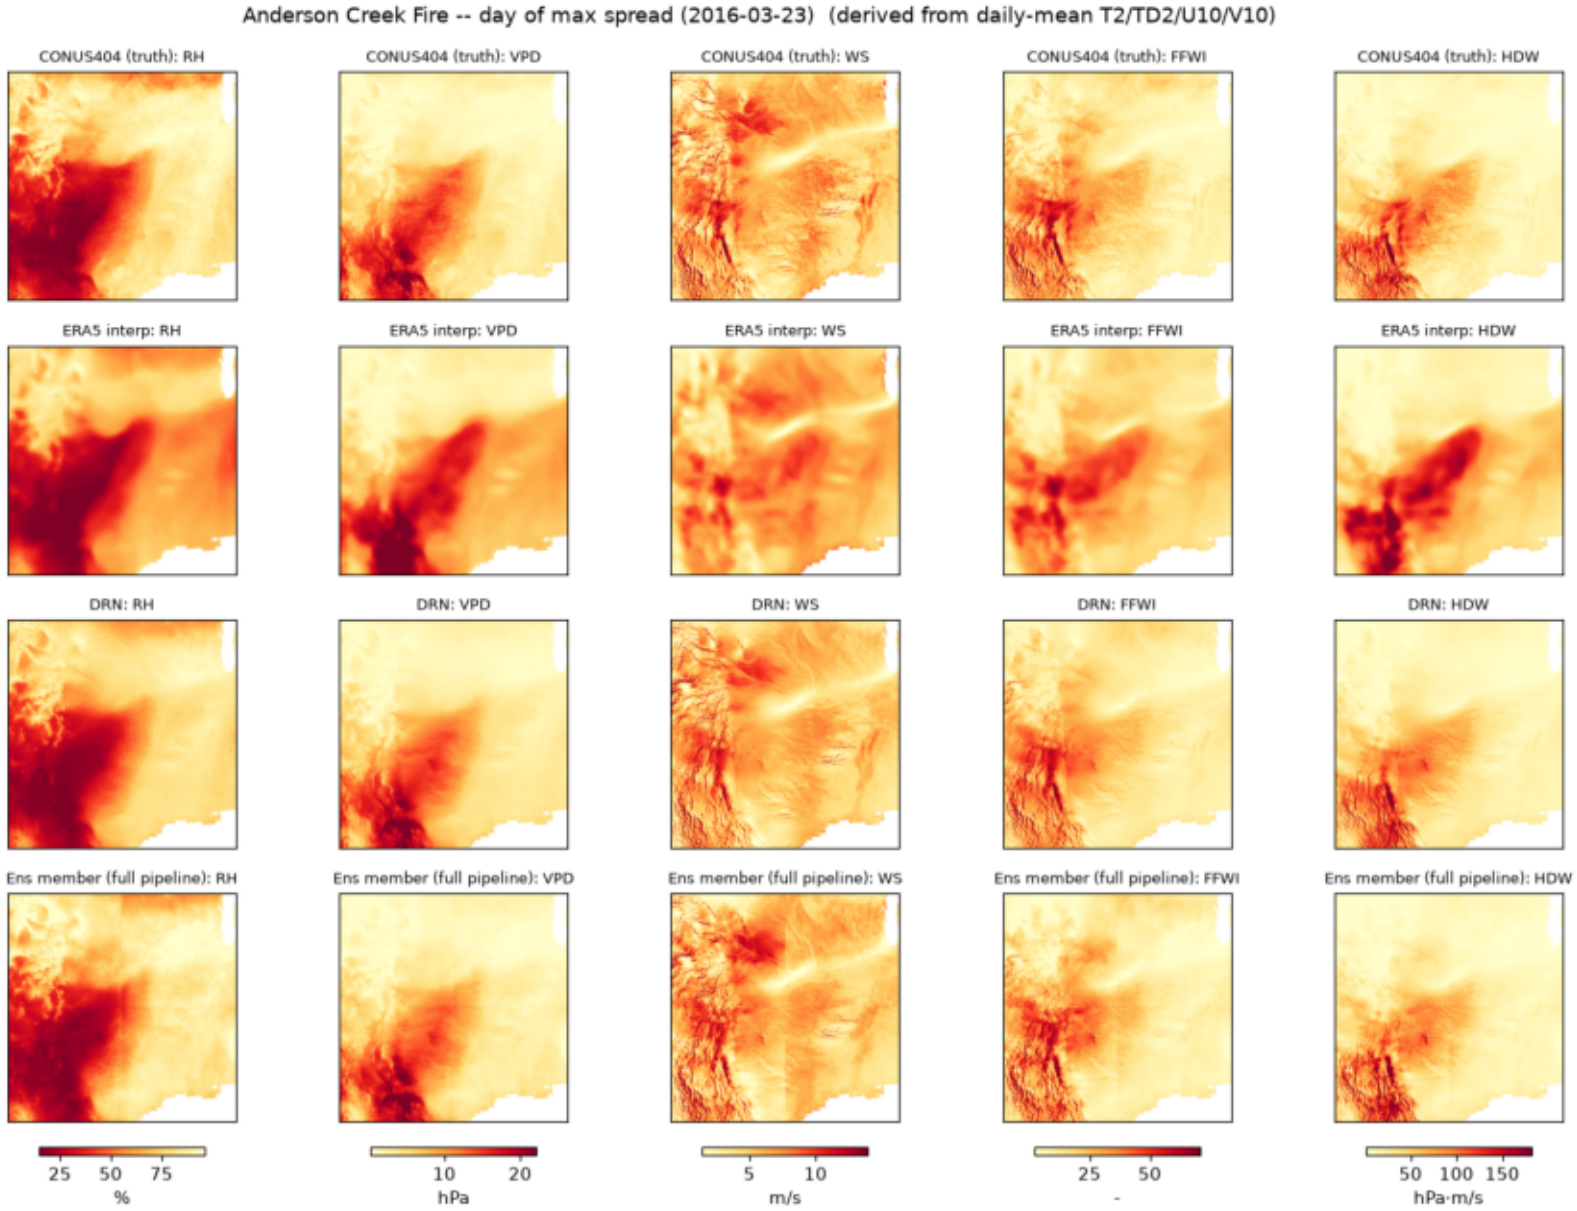

corrdiff vs ours, 2020-08-19, same date, different map locations

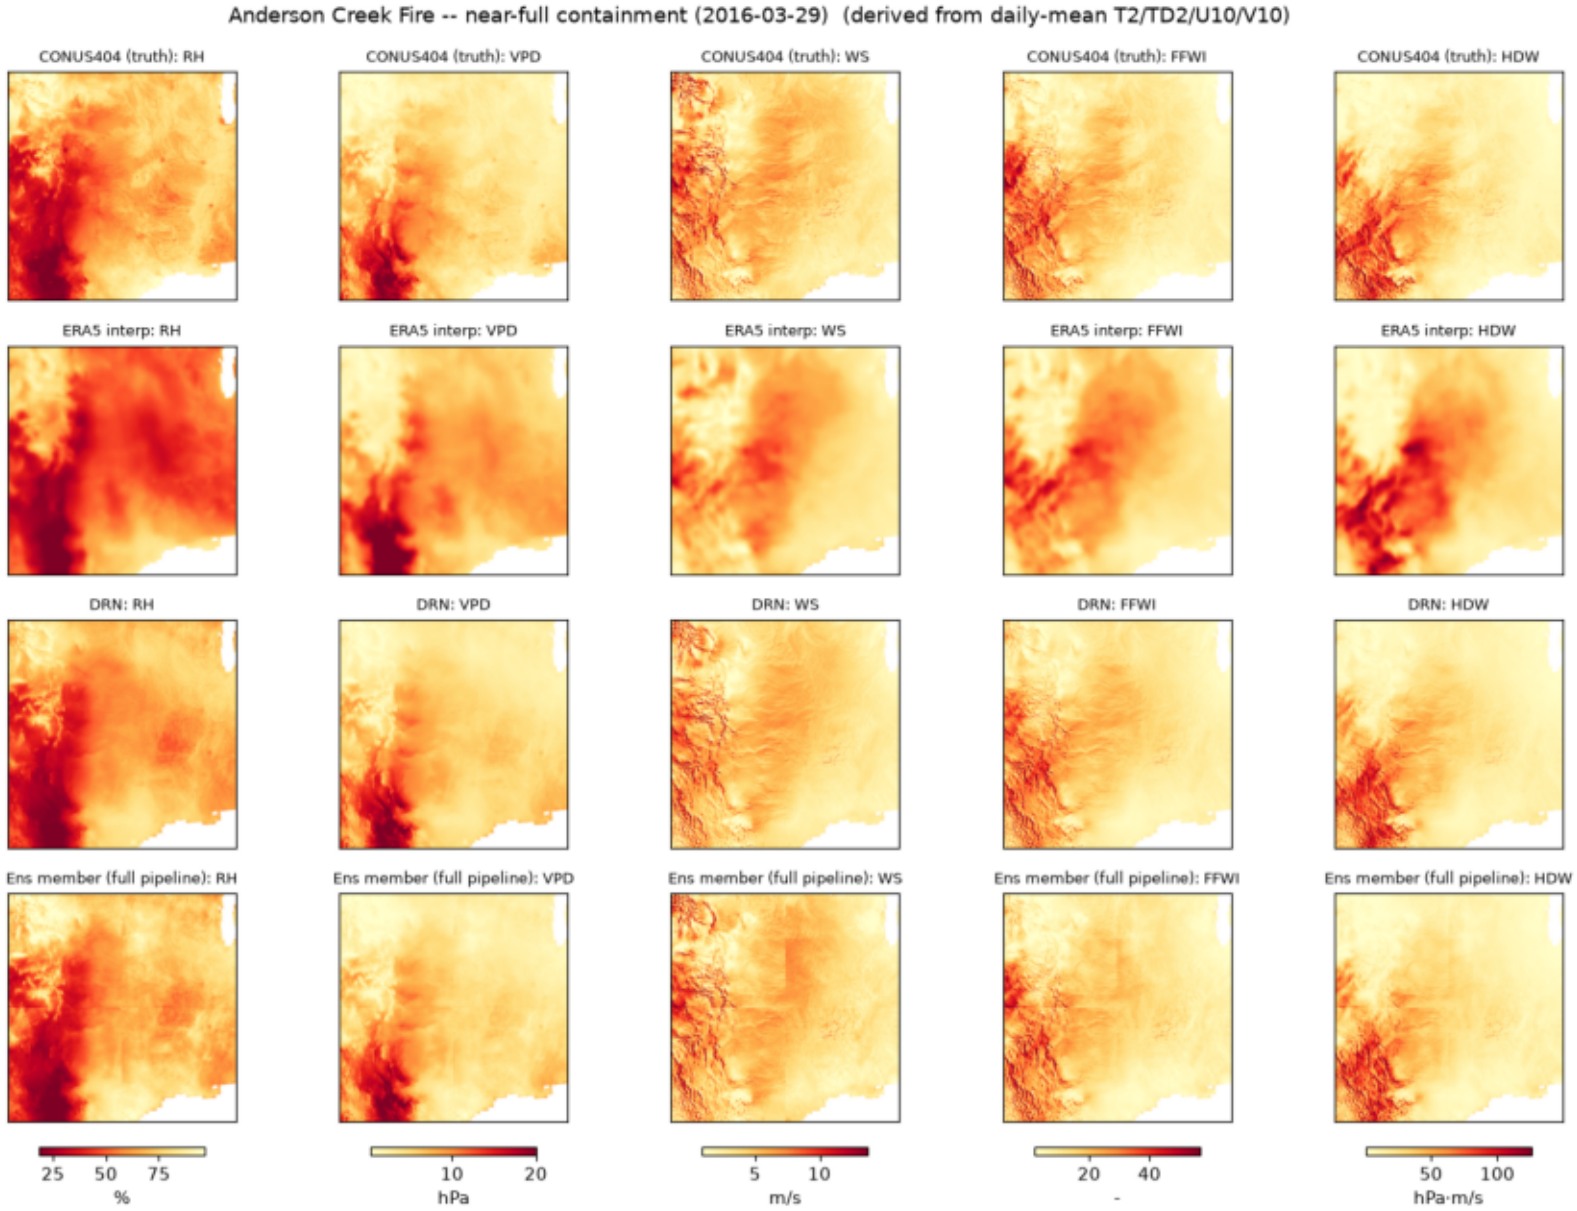

Anderson Creek Fire, day before ignition (2016-03-21)

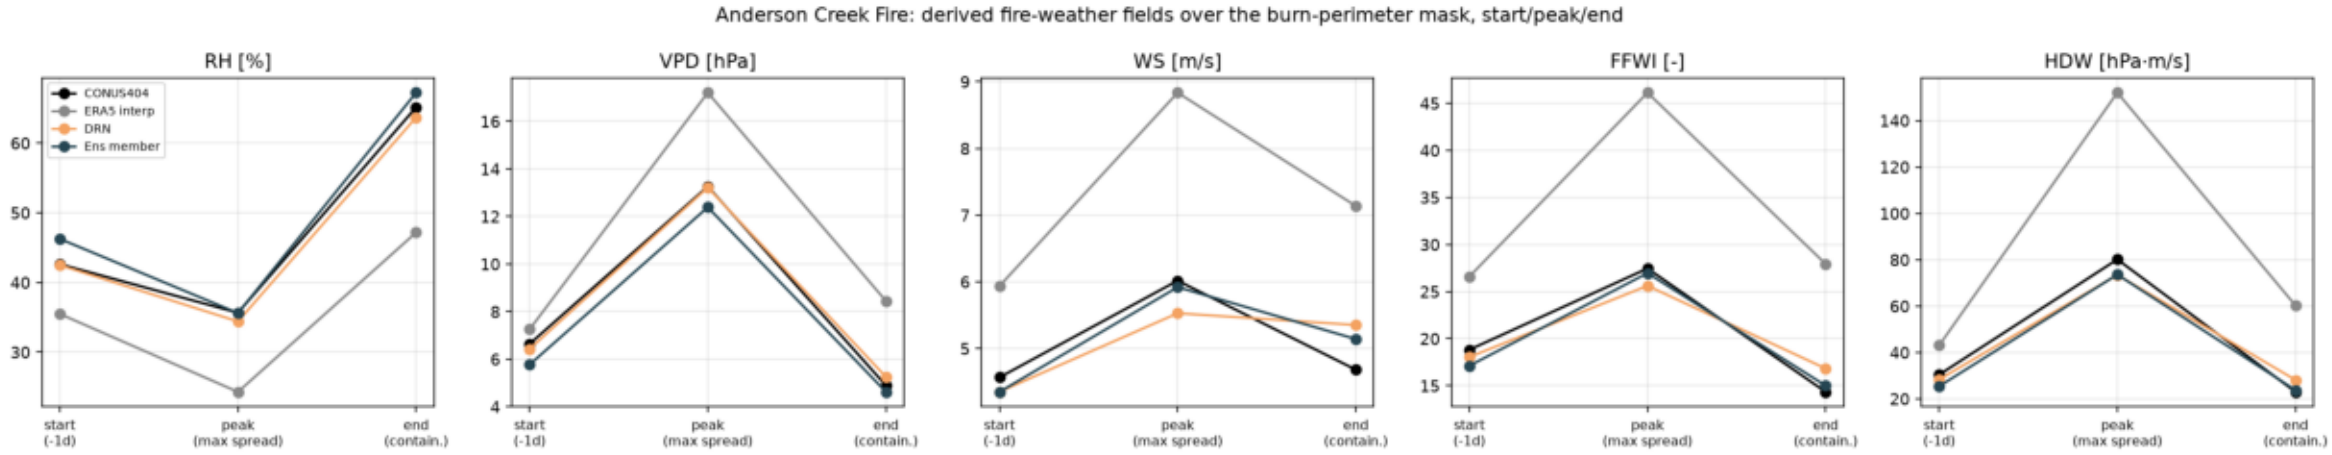

Anderson Creek Fire, day of maximum spread (2016-03-23)

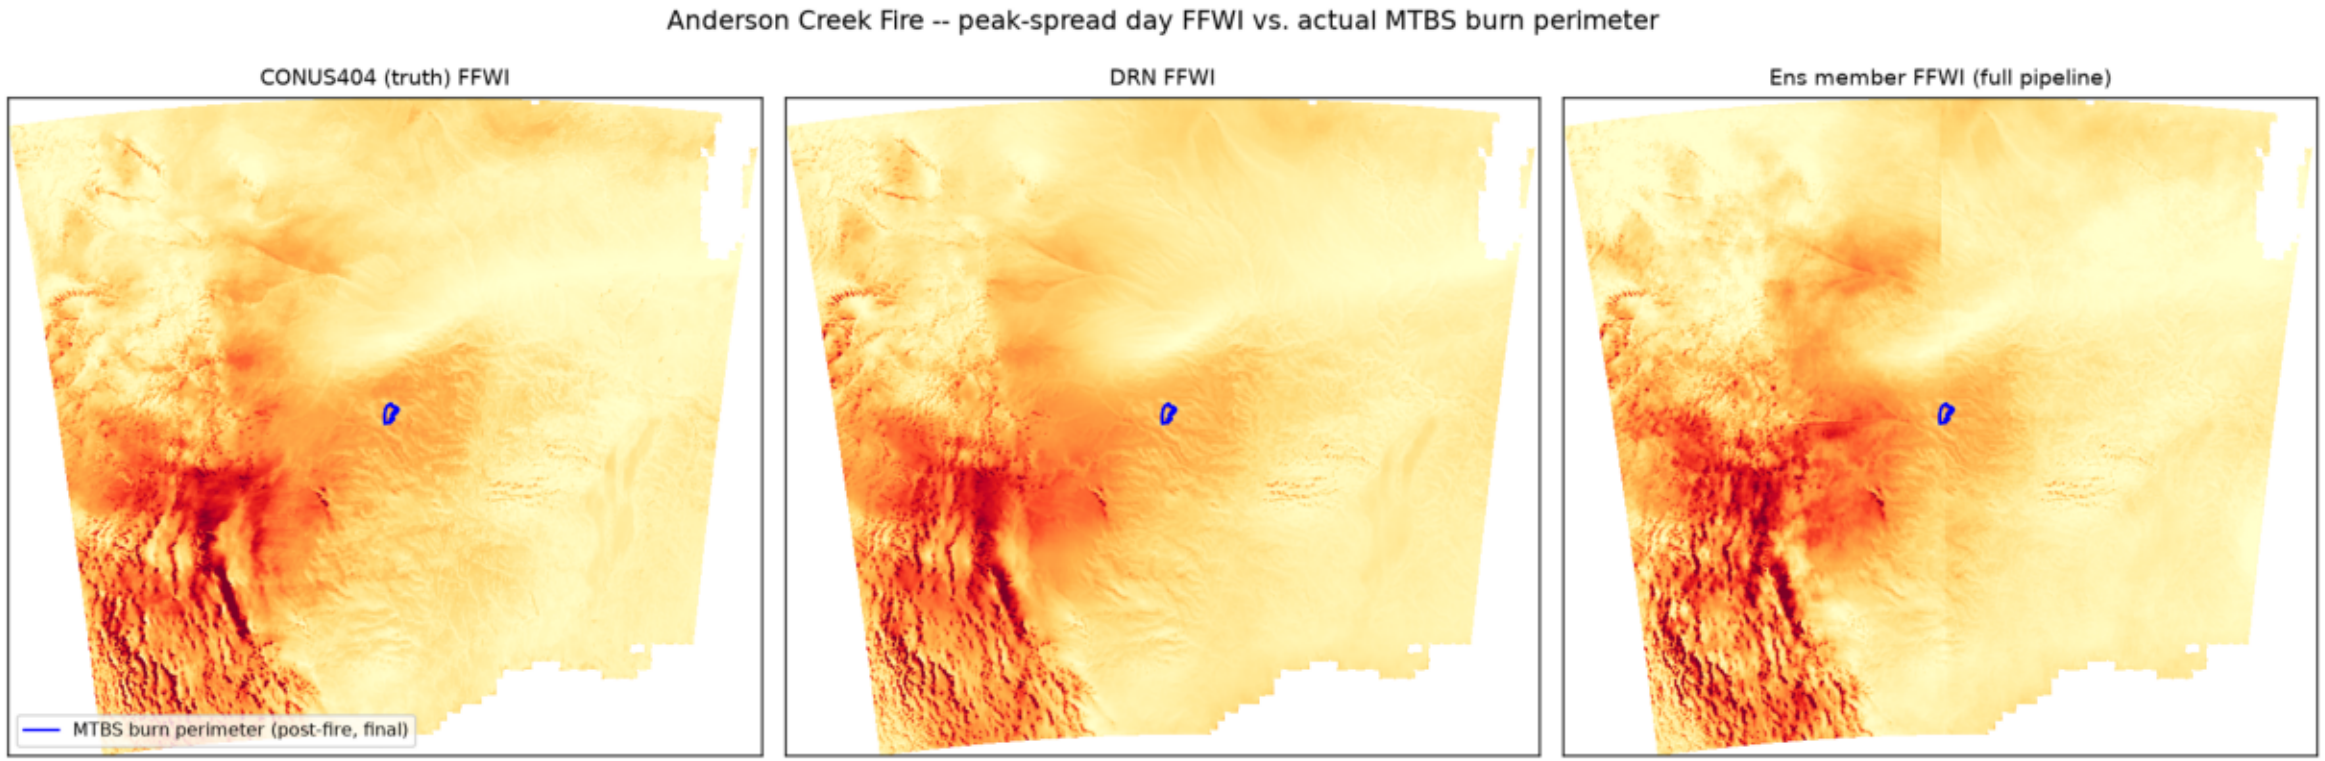

Anderson Creek Fire, near-full containment (2016-03-29)

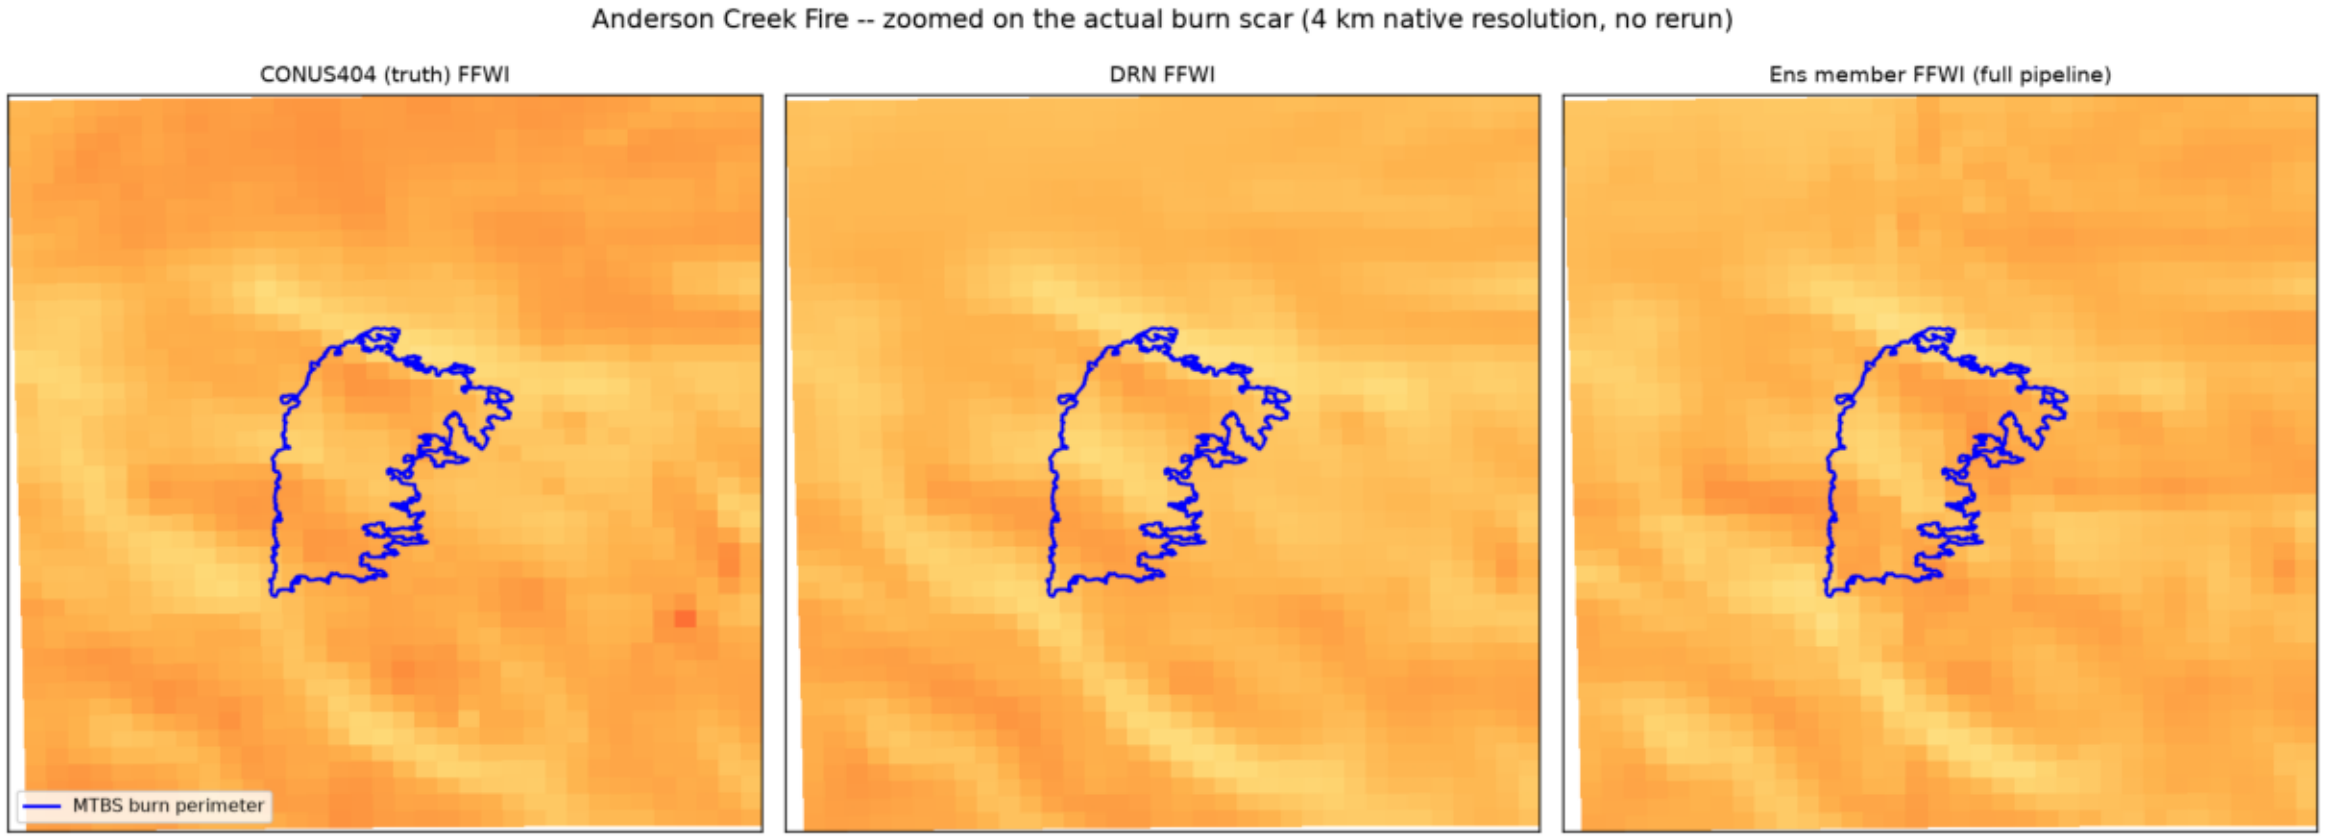

Fire-weather timeline: start → peak → containment

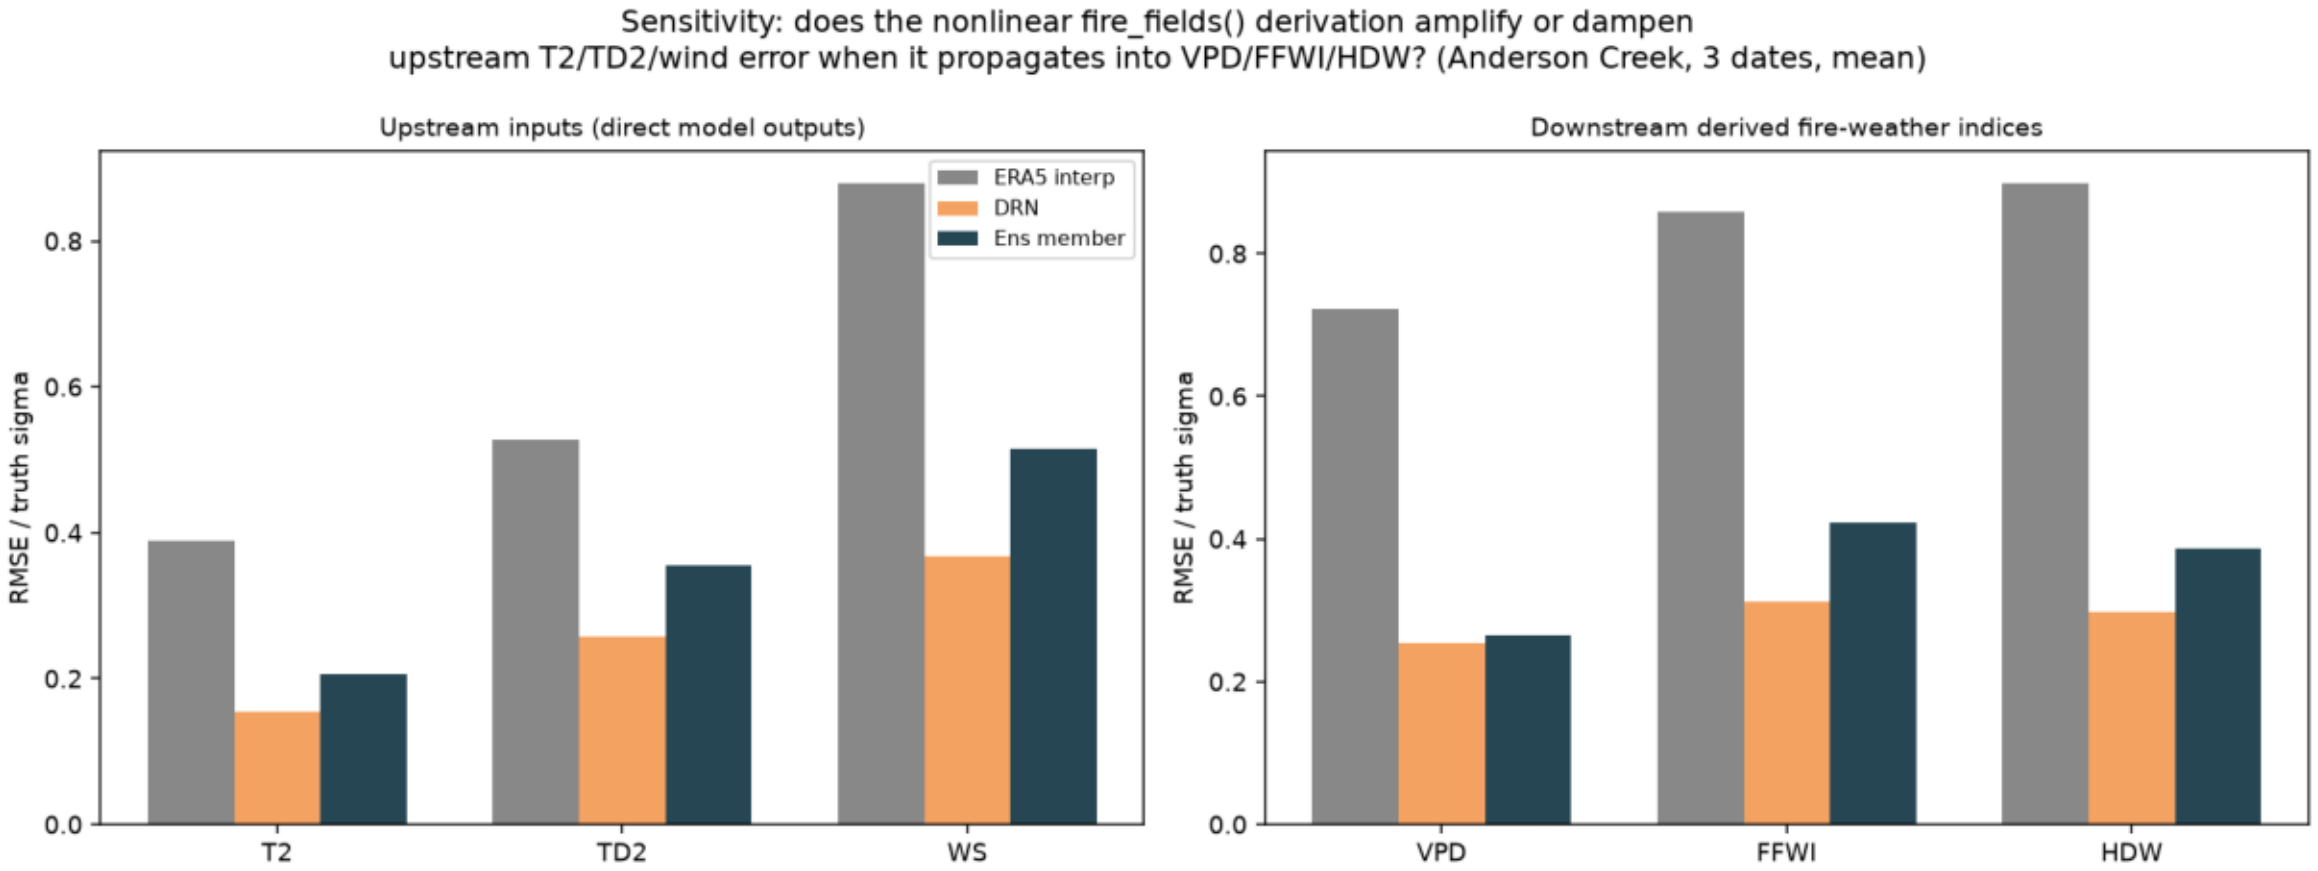

Peak-spread FFWI vs. the actual MTBS burn perimeter

Zoomed on the actual burn scar (4 km native resolution)

Sensitivity: does the fire-weather formula amplify upstream error?

Independent station check (AVK ASOS, ~46 km from the fire) vs. model
